About

Visar Ademi, AI & Partners

Hands-on software and machine learning engineering for AI that has to work, and keep working, on real-world data.

Summary

Visar Ademi is a developer at AI & Partners with 12 years of experience in software engineering. He is responsible for the technical build of the AI & Partners AI Governance Platform, the company's product for registering, monitoring and reporting on AI systems across teams and providers. He builds and deploys the platform himself, including its containerised version and its integration with client cloud environments on Microsoft Azure.

His work sits on the measurement side of machine learning: tracking whether models perform as intended once they meet real data. The platform he builds scores models on accuracy, precision, recall and F1, measures data drift feature by feature against the data a model was built on (using Jensen–Shannon divergence and per-model warning and critical thresholds over 7, 30 and 90 days), scores the faithfulness of generative AI answers against their sources, and attributes token cost and usage by application, agent and team.

Visar is a named team member for AI & Partners on the Horizon Europe project Q-AIM (grant agreement 101319251), which builds a European investment and syndication network for quantum and AI start-ups. There he supports AI & Partners' technical contribution, including the data and tooling that partners use to track deliverables and reporting.

He builds proofs of concept himself rather than advising from the side lines, and measures model performance reproducibly: fixed time-based train/test splits, repeated runs with reported variance, comparison against naive and seasonal baselines, and documented assumptions and preprocessing. He translates the results into clear feasibility conclusions for non-technical decision-makers.

Extended

I'm Visar Ademi, a developer at AI & Partners. Over 12 years I have worked as a software engineer, and for the past several years my focus has been building the systems that keep AI accountable once it is in use. At AI & Partners I lead the technical build of our AI Governance Platform: from containerisation and cloud deployment to the monitoring components that track model performance and drift. That work keeps me close to a practical question that matters for every AI project: does the model still perform on the data it actually sees?

The same question sits at the heart of transfer learning for small organisations. SMEs rarely have more than a few years of history or a few hundred campaigns, so the value of a model depends on how well pre-trained knowledge carries over to very limited company data, and on measuring that honestly. Comparing a model against simple baselines, checking whether new data has drifted from what the model learned on, and reporting variance rather than a single best run are the same disciplines I build into our platform every day.

For the MIT-28436 feasibility study I would act solely as the independent ML specialist. I have no role in any governance review or legal advisory work that AI & Partners may carry out for Inclufy, and I have no

ownership, control, financial or family ties with ePROCURE Consulting B.V. (trading as Inclufy). Findings, including unfavourable ones, will be reported in full.

Relevant reference projects

Reference 1: AI & Partners AI Governance Platform

- **Client and sector:** AI & Partners B.V. (own product), AI governance software for regulated sectors including financial services, insurance, healthcare and retail
- **Period and role:** 2025 – present; developer responsible for the technical build and deployment
- **What was done:** Built the platform's four core modules: Model Monitoring (accuracy, precision, recall, F1 over any period), Model Drift (feature-level drift scoring against a baseline with warning and critical thresholds), Hallucination Detection (faithfulness scoring from 0 to 1 with claims traced to source) and Token Cost & Usage (cost and token attribution by app, agent and team, with CSV and JSON export)
- **Result:** A working platform that monitors classical models and large language models from any provider in one view and produces audit-ready evidence for EU AI Act post-market monitoring
- **Reference contact:** Michael Borrelli, Director, AI & Partners, m.borrelli@ai-and-partners.com

Reference 2: Client implementation of the platform for KiteEdge

- **Client and sector:** KiteEdge (United Kingdom), technology
- **Period and role:** June 2026 – present; developer leading the technical implementation
- **What was done:** Built a containerised version of the AI Governance Platform for deployment in the client's own Microsoft Azure environment, including environment set-up and API integration with the client's systems
- **Result:** Platform deployed in a client-controlled cloud environment, so the client can monitor its own AI systems without data leaving its infrastructure
- **Reference contact:** James Flavin, KiteEdge, james@kiteedge.co.uk

Reference 3: Horizon Europe project Q-AIM (101319251)

- **Client and sector:** European Commission, Horizon Europe (managed by EISMEA); consortium coordinated by DeepTechFoundry; quantum and AI innovation and investment
- **Period and role:** July 2026 – present (36-month project); team member for AI & Partners B.V.
- **What was done:** Supports AI & Partners' technical contribution to a European quantum and AI investment and syndication network, including the data structures and tooling partners use to track investors, deliverables and reporting evidence
- **Result:** Consortium agreement signed in October 2026; project kick-off in London in November 2026
- **Reference contact:** Antti Heikkilä, DeepTechFoundry (project coordinator), antti@deeptechfoundry.com
